Main Board

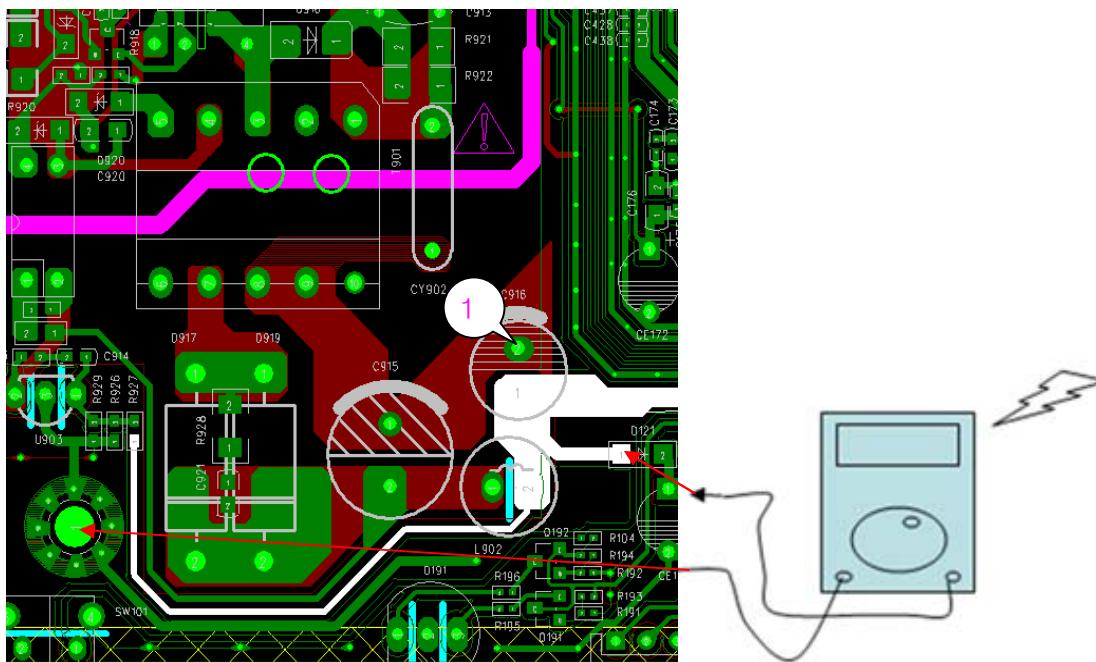

Main Board Trouble Shooting Guide (DTT1609)

Here are the procedures you can refer to whenever terrestrial receivers do not operate properly. You can check problems and repair the units on the basic level according to the following procedures

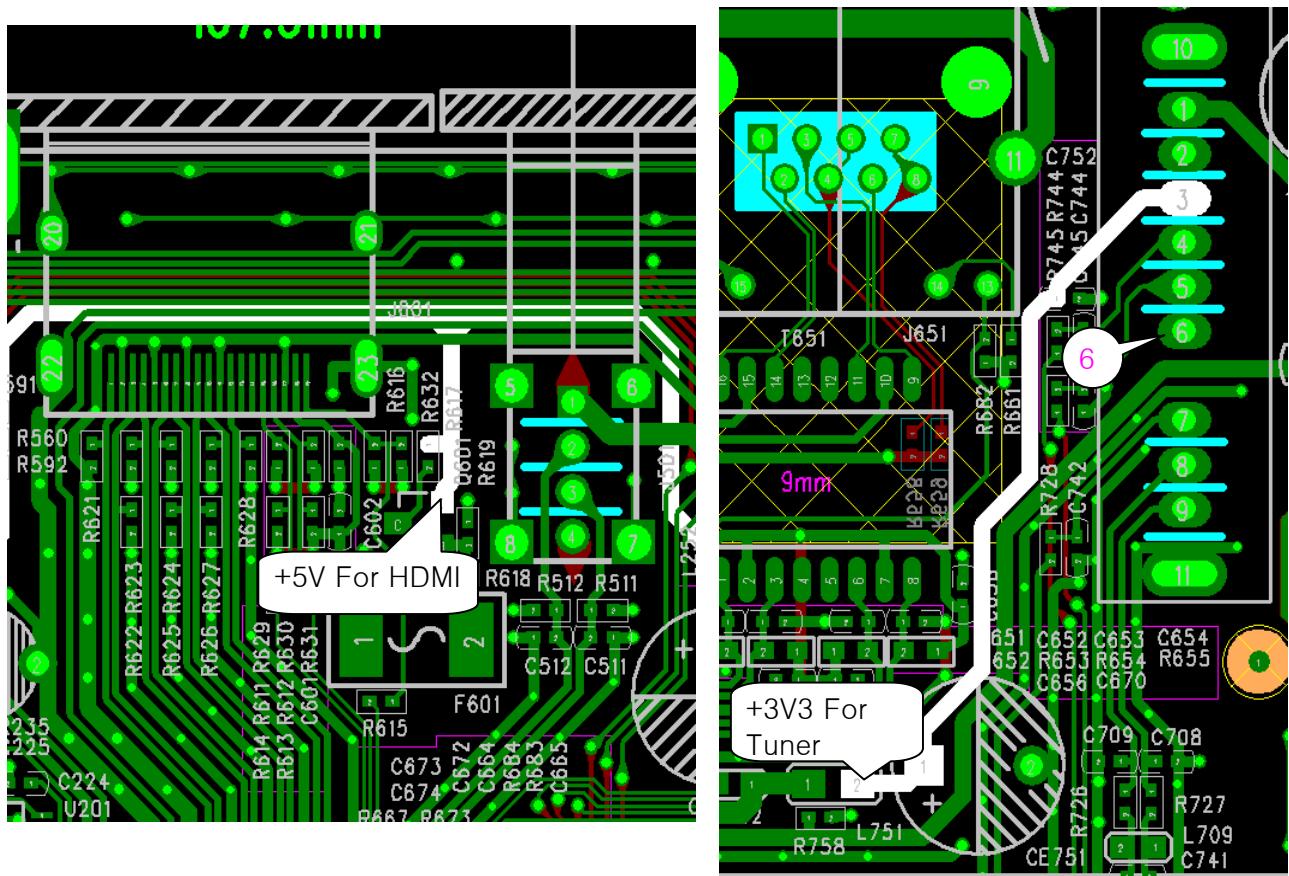

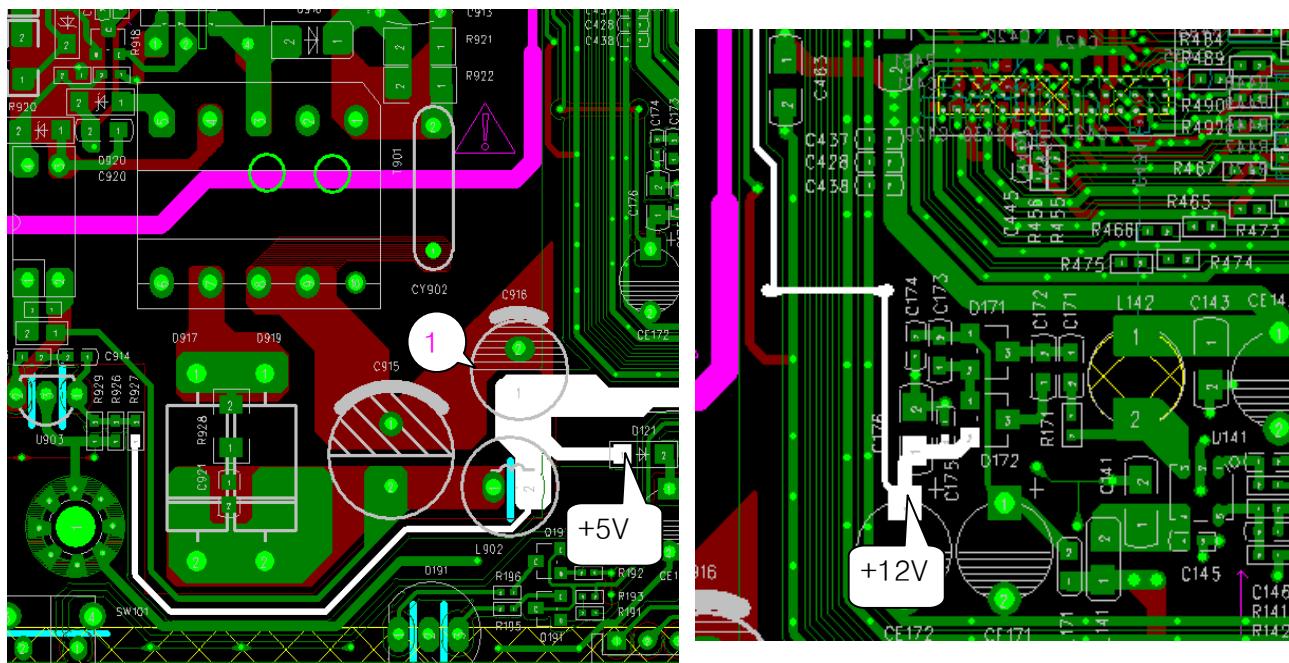

1. SHORT TEST

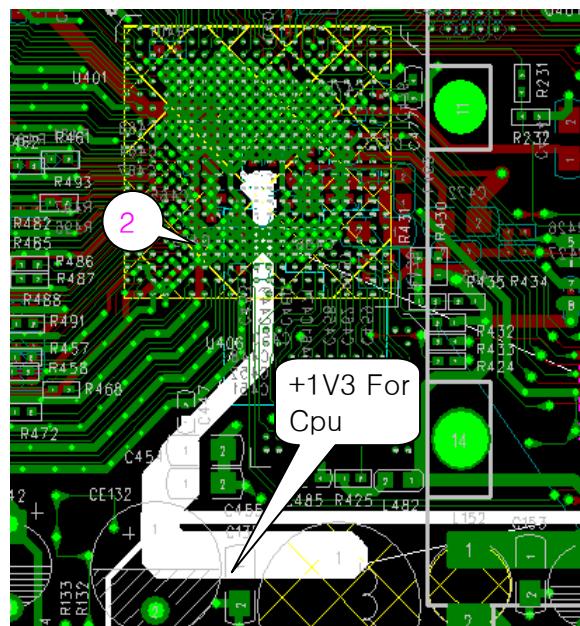

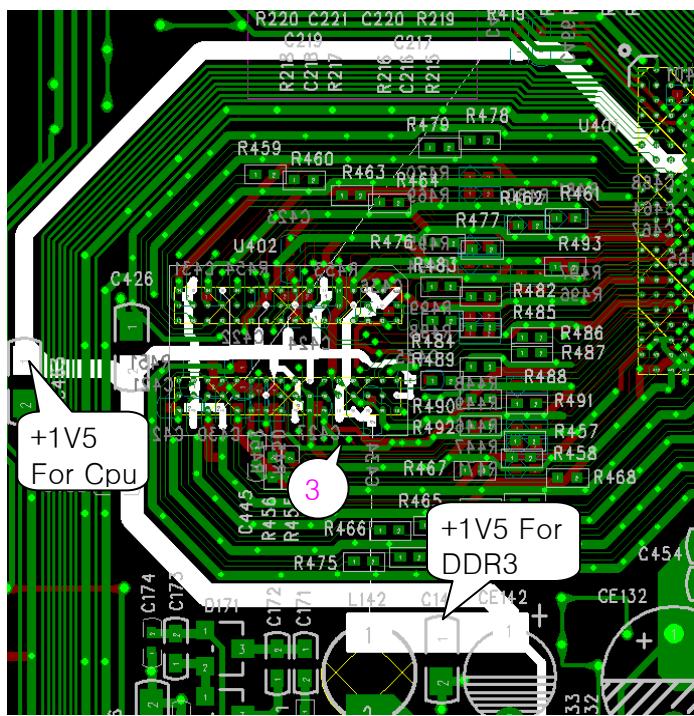

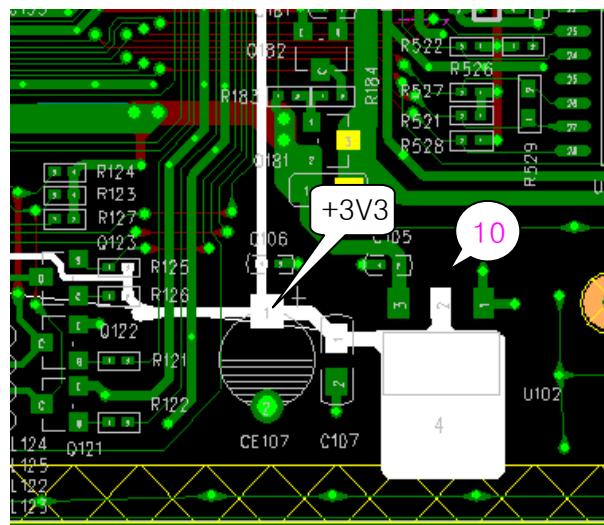

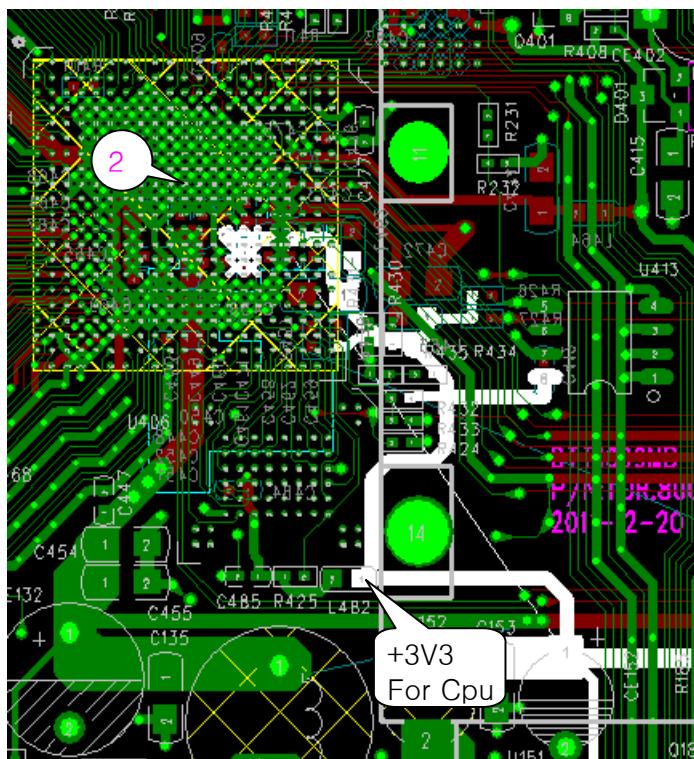

Before turning on AC power, check POSITIVE VOLTAGE and also check whether SHORT between GROUND's and PIN SHORT for TUNER are detected or not.

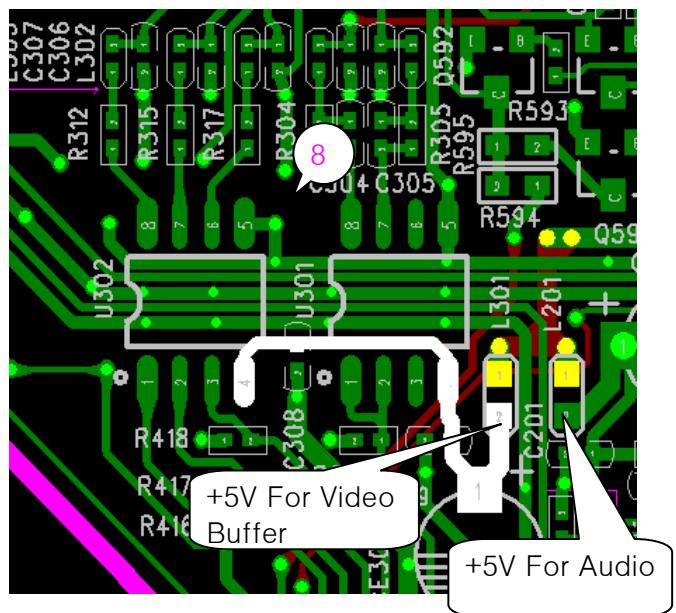

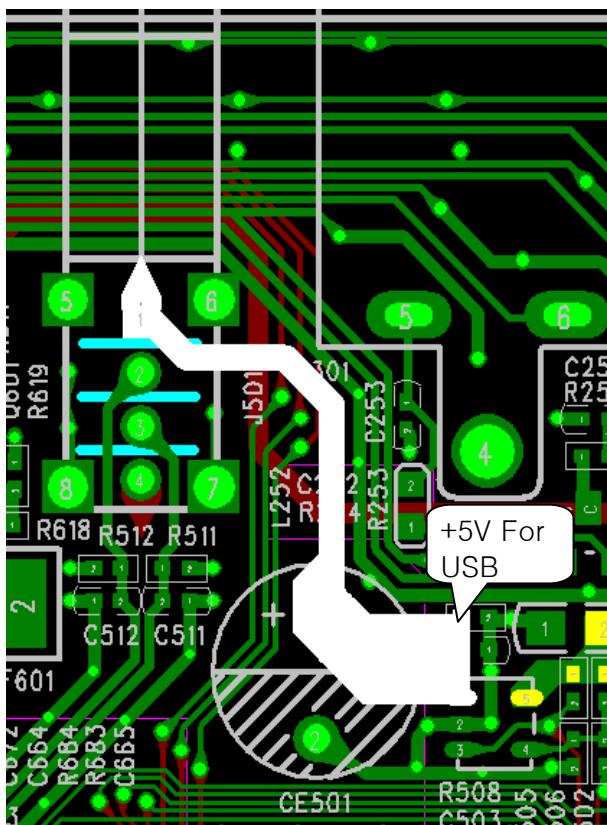

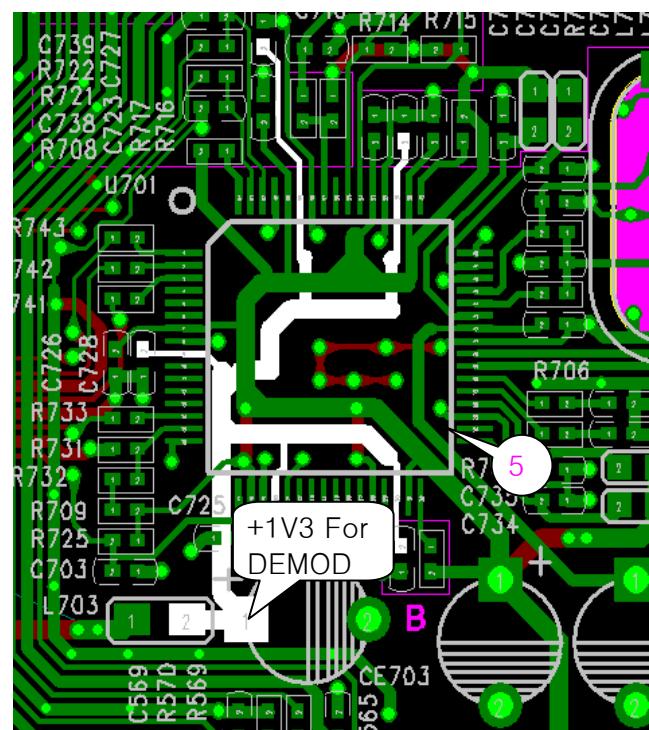

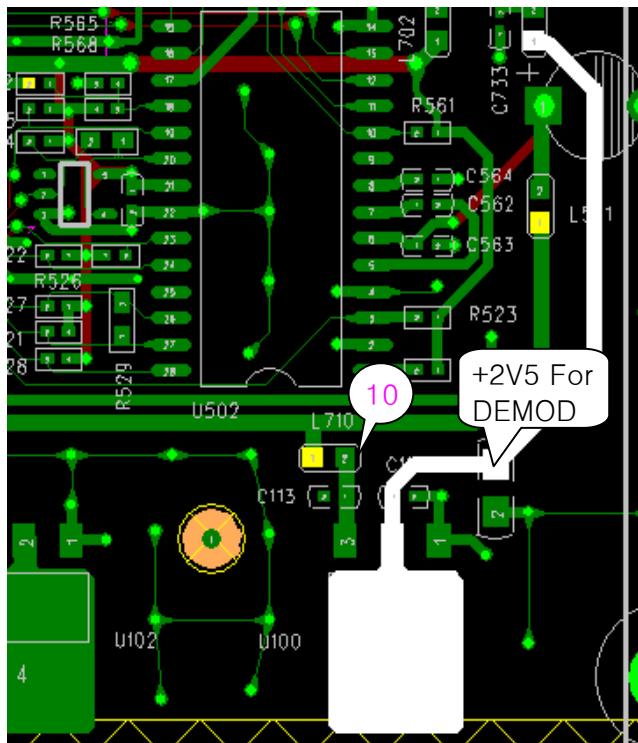

2. Checking POWER.

+12V (SCART) , +5V (ANTENNA_POWER, IR, VIDEO BUFFER, HDMI, USB) , +3.3V (TUNER, FLASH, CPU) , +2.5V (DEMOD) , +1.5V (DDR3, CPU) , +1.3V (CPU DEMOD)

3. Check MAIN CLOCK 24MHz and SYSTEM CLOCK (PLL) to operate normally after SYSTEM operates.

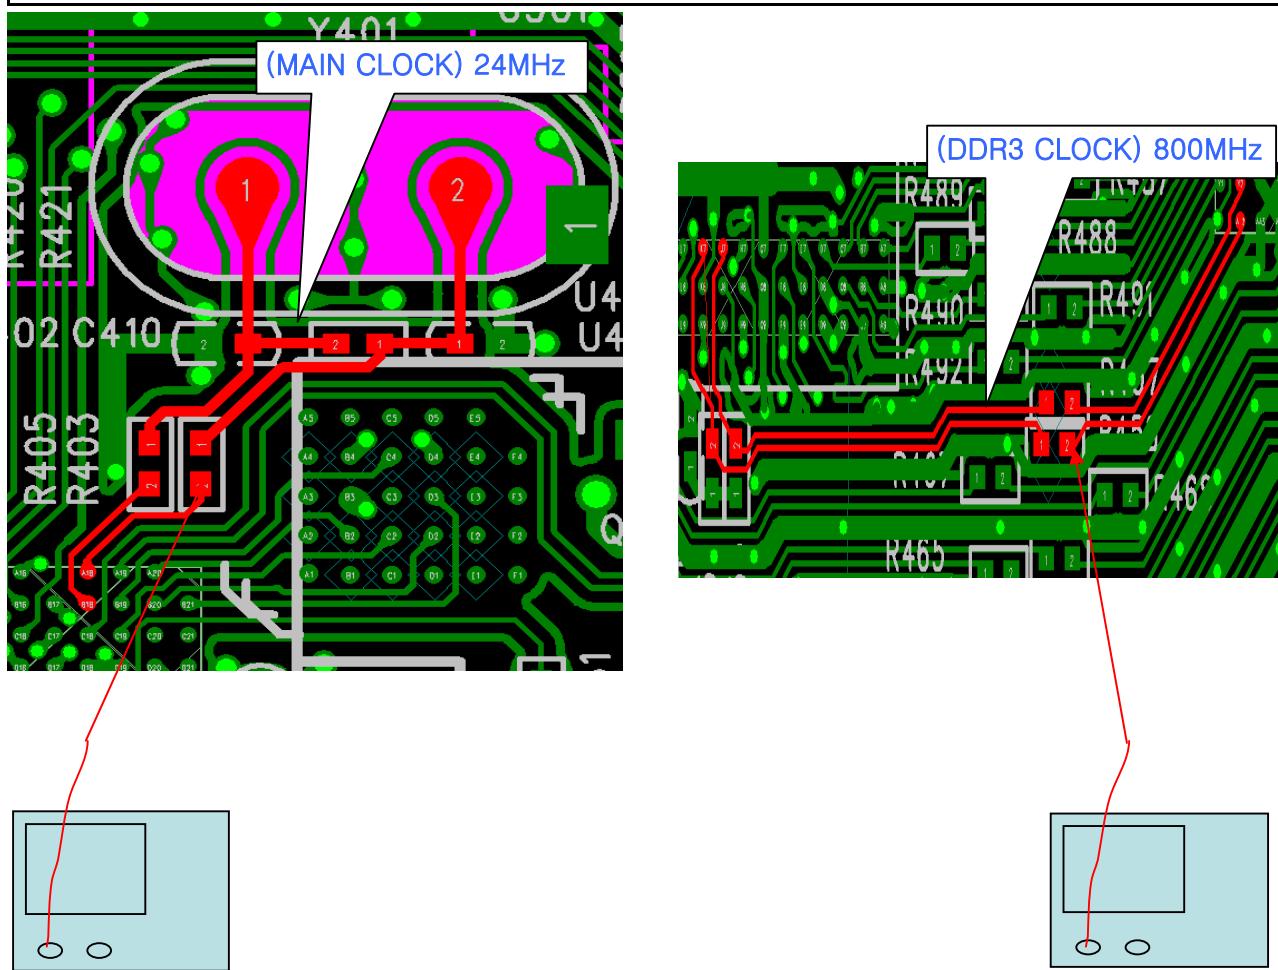

☞ For the first thing, check 24MHz from Y401 flows into [OSCI(PIN B18)] of MAIN CPU

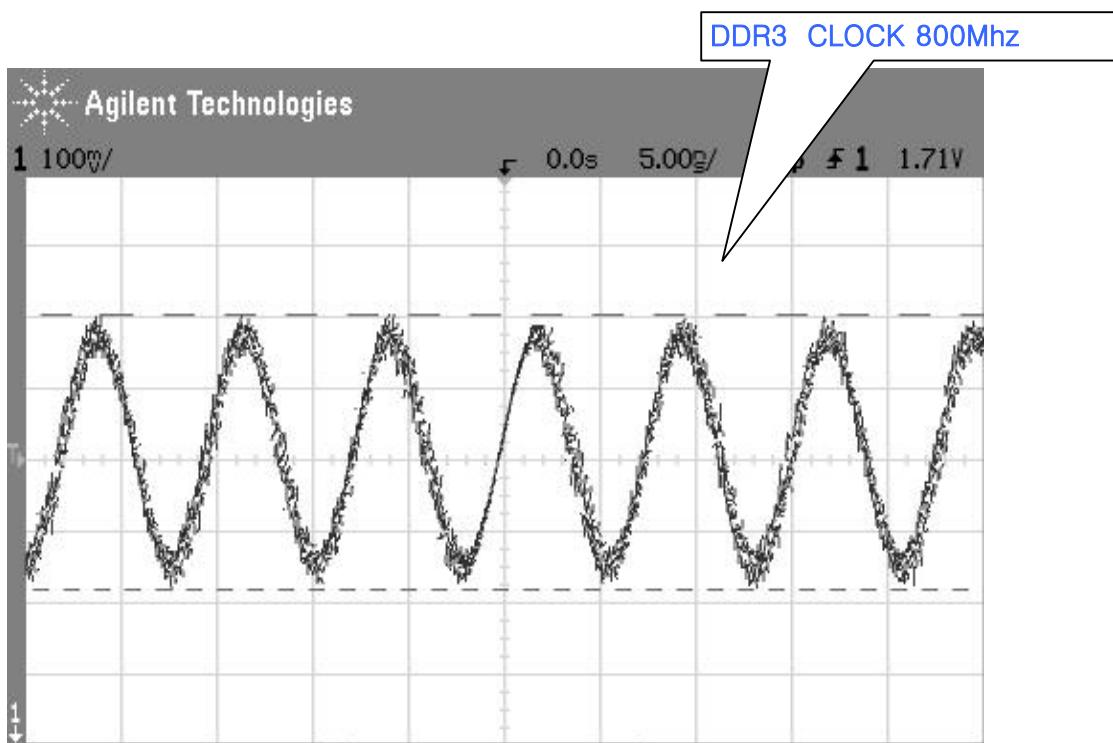

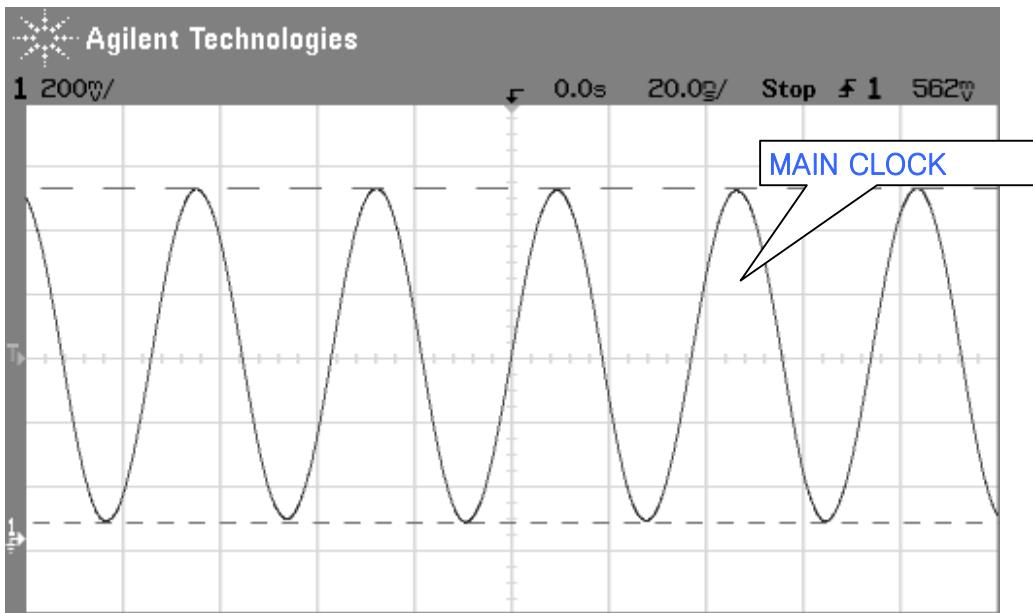

If the 24MHz is unstable, Check Y401 is damaged or not.

If you are firm belief of damage for the device, then replace the device.

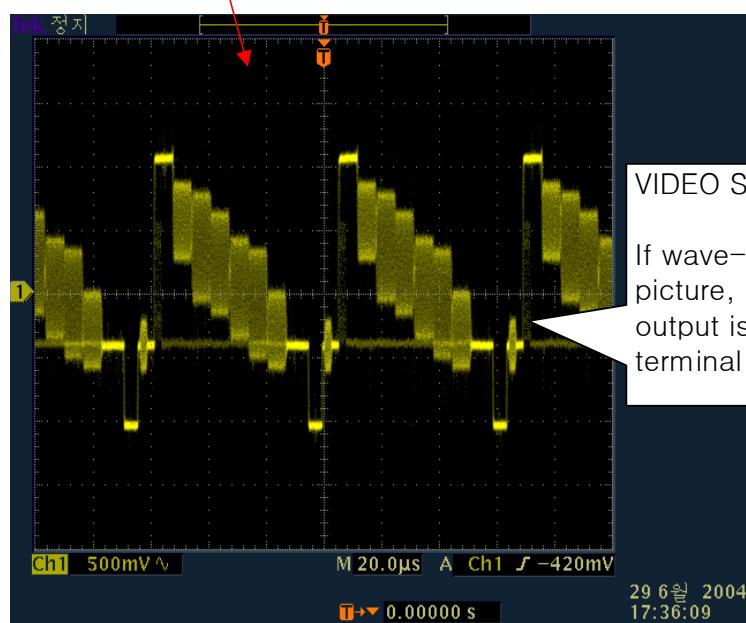

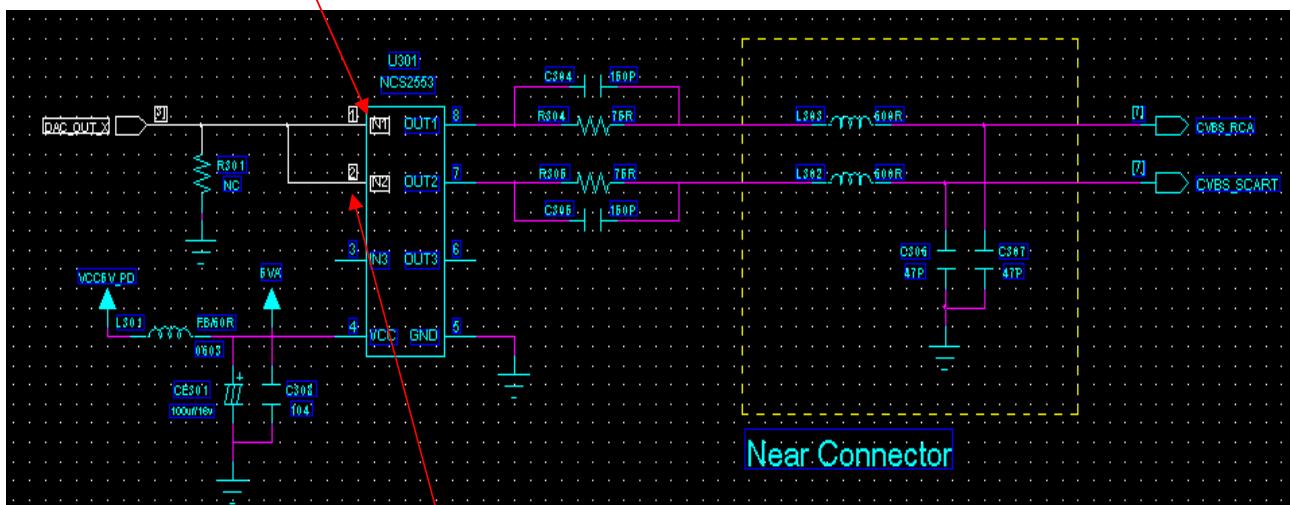

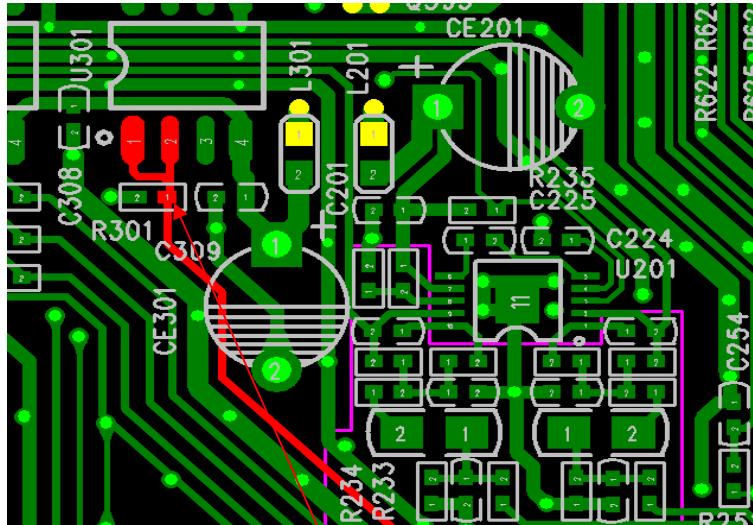

☞ And then, check that 800MHz is being supplied to DDR3 with RESET

If the clock 800MHz on Pin-J7&K7 of U401 is not generated from inside of the chip, Please check the soldering state of U401, U402 and U403

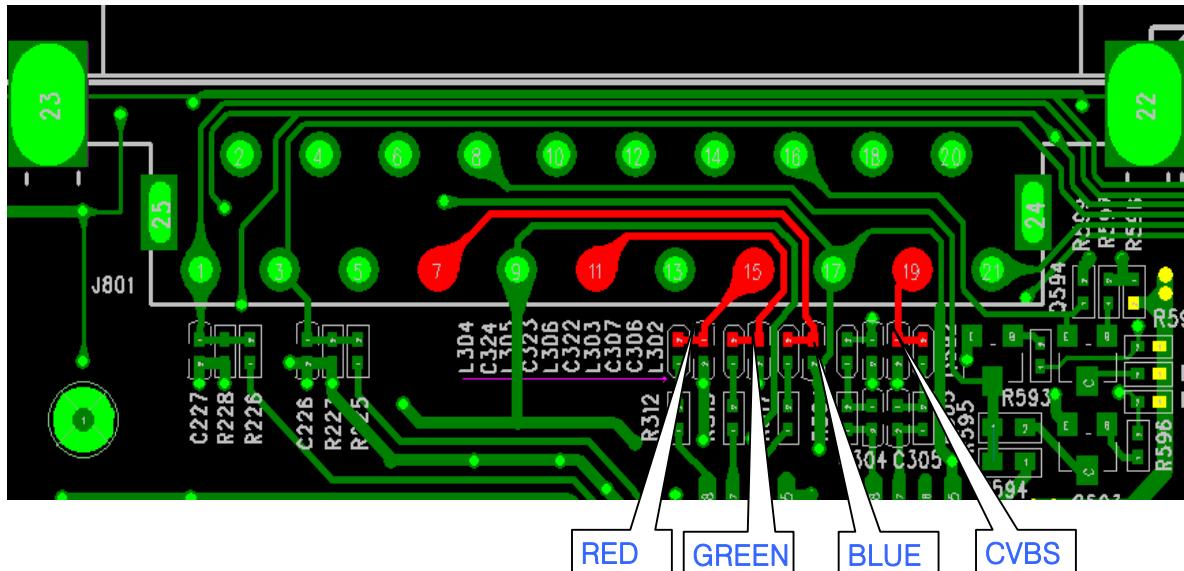

4. In case that MAIN CPU operates normally but there is no VIDEO display.
 - ▶ In case of no OSD display.
 - ☞ If OSD is not displayed, check first if VIDEO SIGNAL is detected from [R419(CVBS), R416(R), R417(G), R418(B)] of MAIN CPU.
 - ☞ And then, check any part with no DATA after checking VIDEO SIGNAL from VIDEO SIGNAL PORT of MAIN CPU, or SCART
 - ▶ In case of no MPEG display
 - ☞ There can be a variety of reasons for the case
 - ☞ Check first that CHANNEL of TP SIGNAL is locked properly.
 - ☞ After this signal input to the resistor connected to MAIN CPU is done normally, A/V DATA comes out from MAIN CPU and flows into MPEG CHIP(MAIN CPU). If there is no problem to here, it is thought that MAIN CPU and channel are operating without any fault.
 - ☞ In case of no MPEG display to this point, inspect any disorder by checking U701(TUNER IC) and I/F of MAIN CPU.

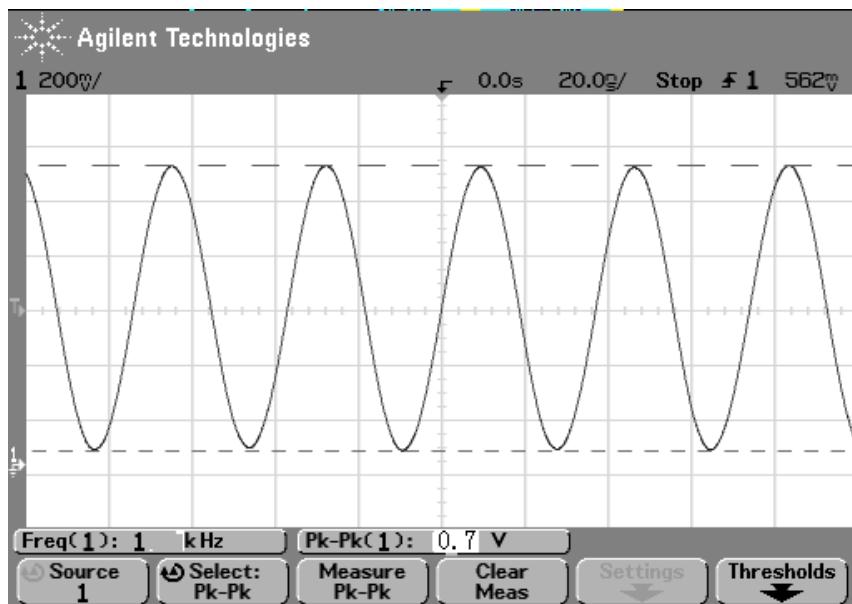

5. In case of no MPEG and no OSD at the same time.

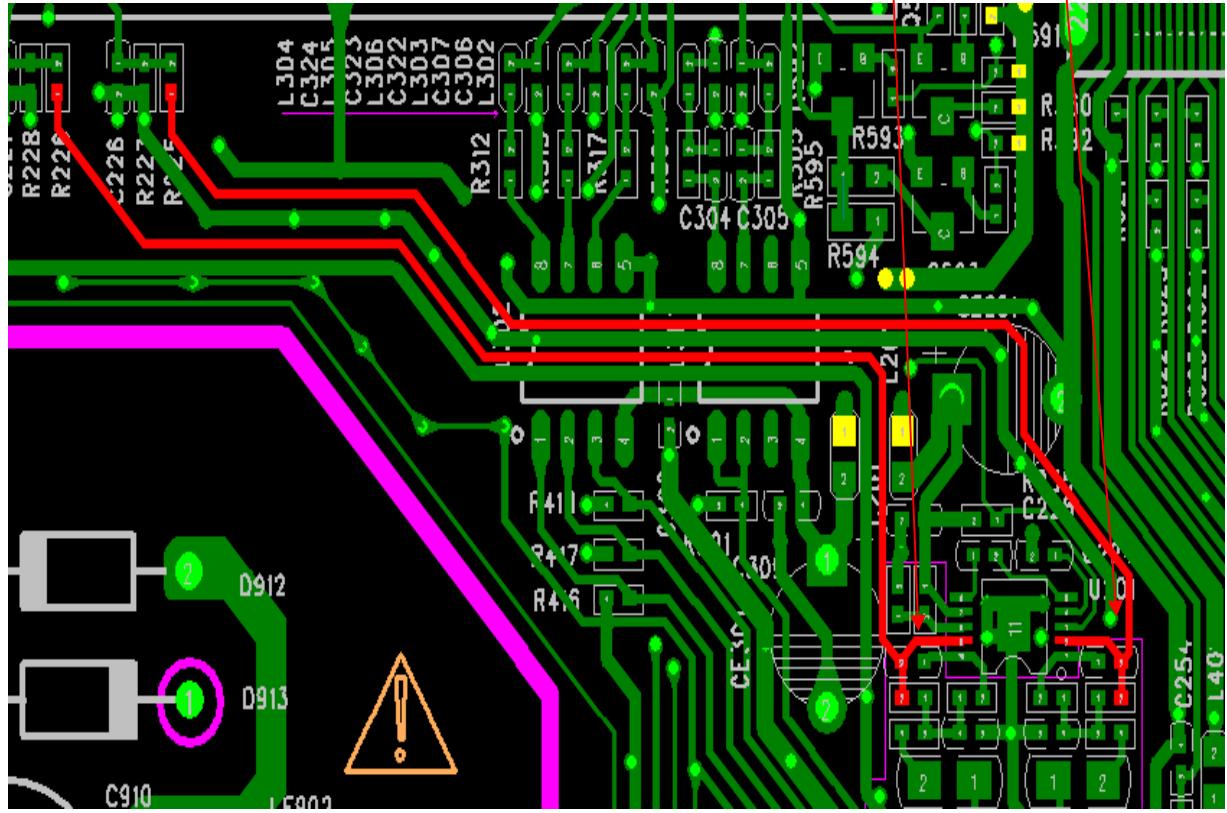

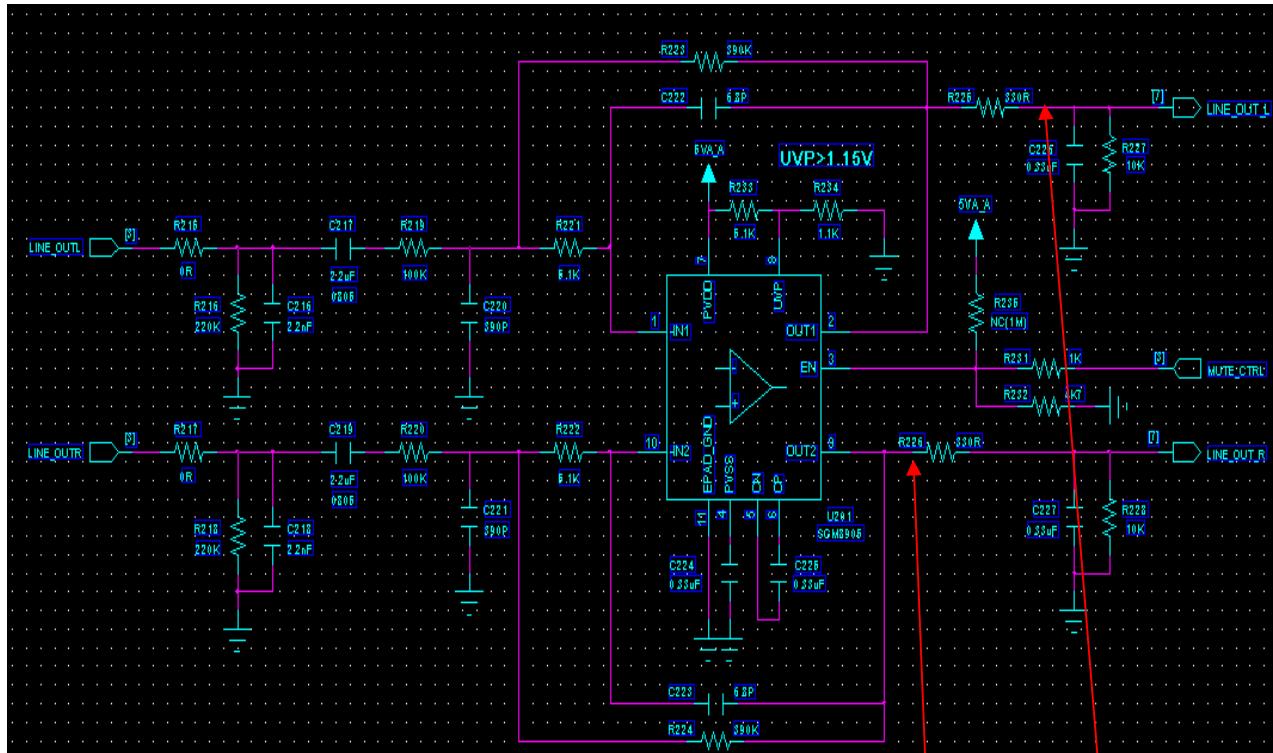

☞ Check that 1Vp_p(0.7Vp_p for RGB) comes out normally from VIDEO PART(CVBS) of MAIN CPU.

7. In case of normal VIDEO SIGNAL flowing out but abnormal AUDIO SIGNAL.

☞ Check that ADAC_L(U201 PIN2), ADAC_R(U201 PIN9) signals have normal inputting and outputting from MAIN CPU. The signal is linked to SCART.

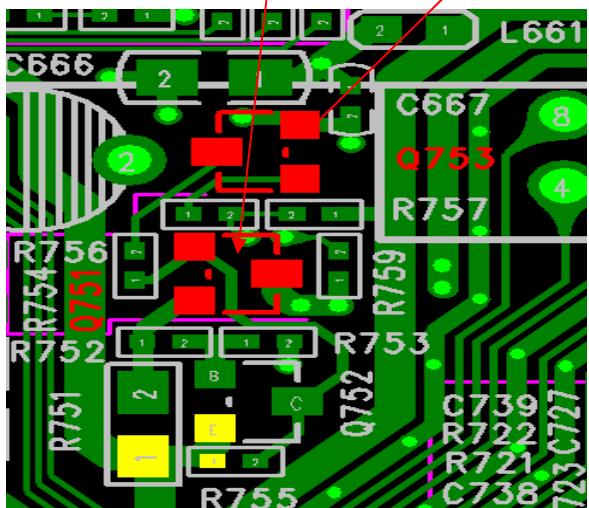

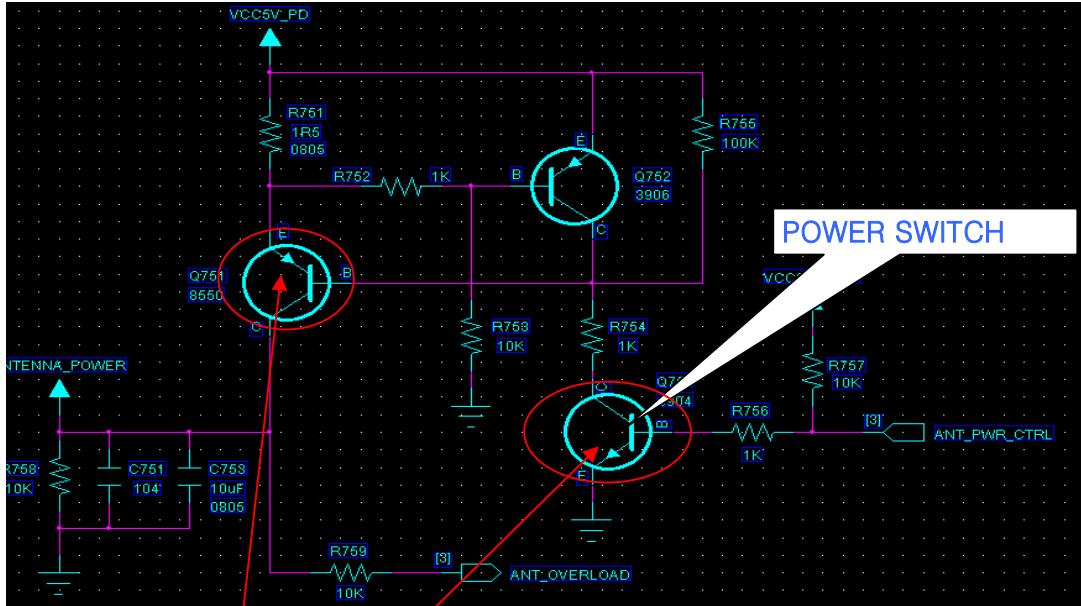

ADDITIONAL TROUBLESOOTHING

1) STAND-BY mode on Set.

Ordinarily, STAND-BY mode results from SHORT on LNB. Check first if TR on LNB has stopped, and then in case that STAND-BY mode resulted from wrong software, down-load a proper software.

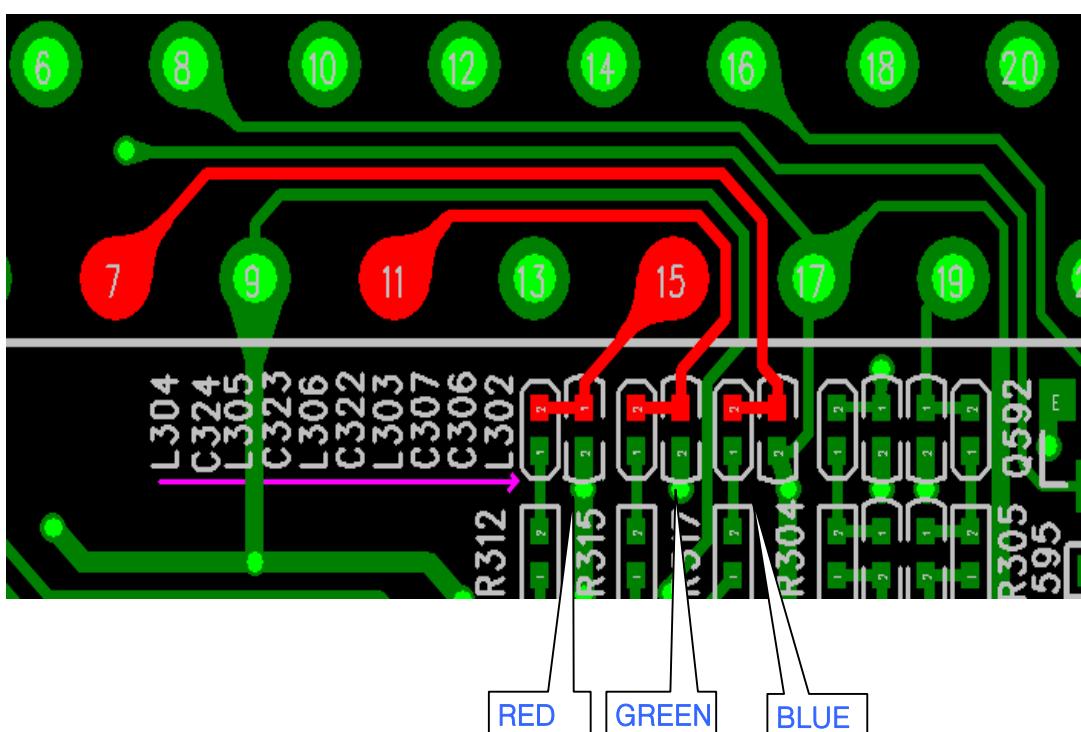

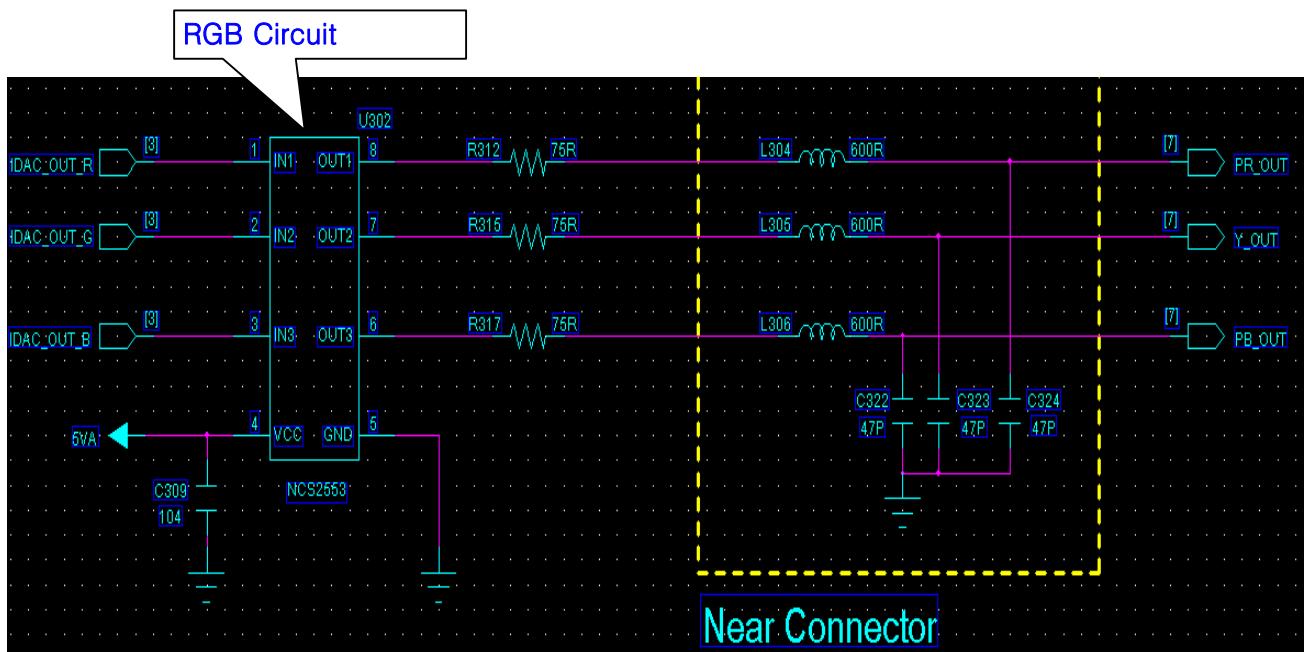

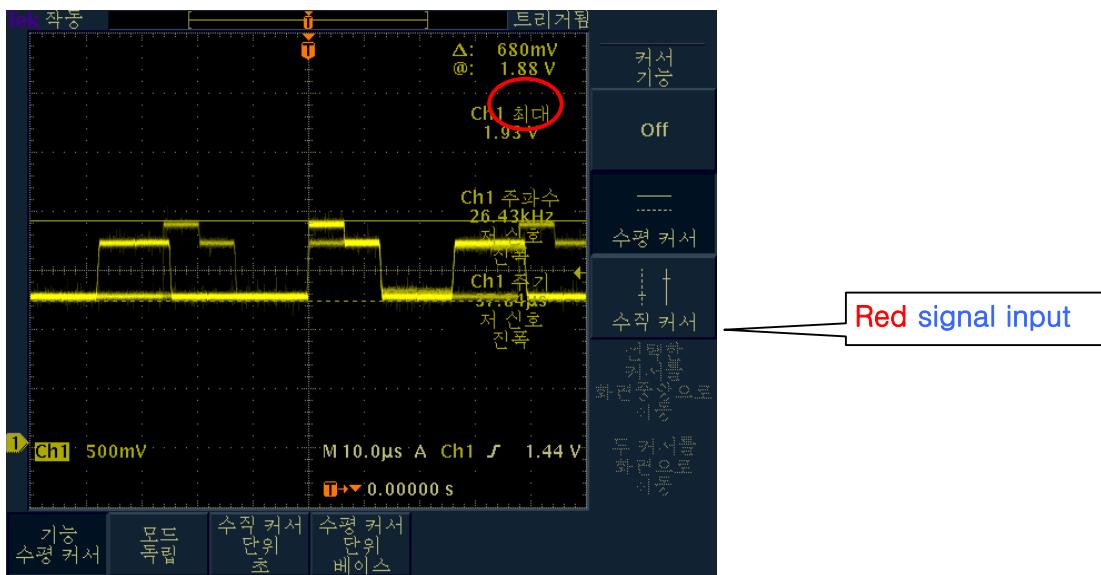

There is a TR's as a switching role on the LNB bundle. 5V comes out normally from Q751. If voltage is not enough or steady, check if the voltage is impressed properly from Q751.

2) Screen problem in color

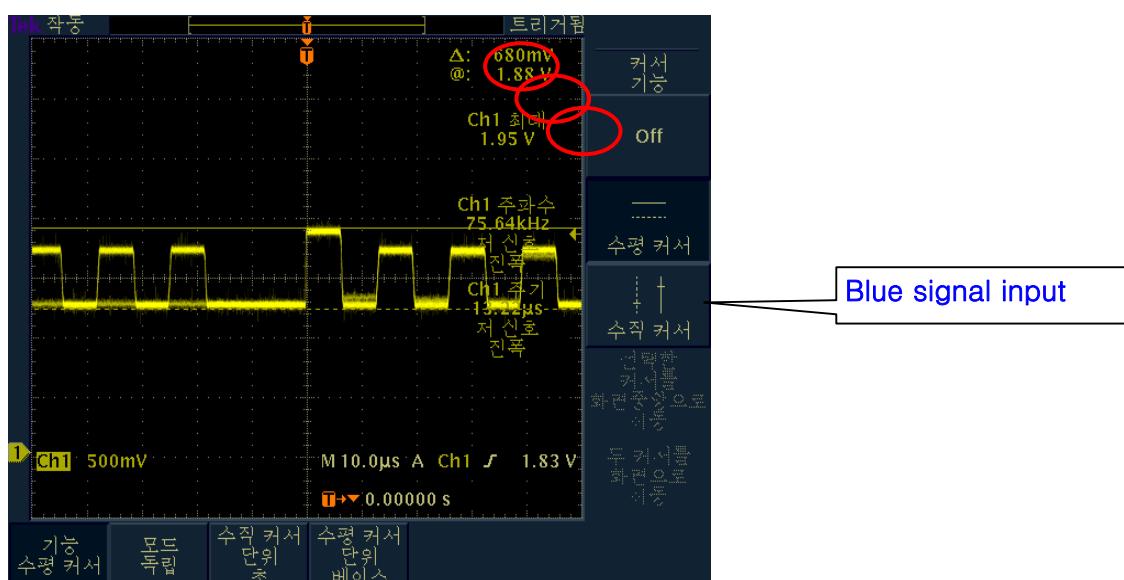

If you have Black-and-White screen. It mainly results from distorted 24MHz frequency.

In case of no screen display or different color displayed, it also mainly results from the Y401 problem. Additionally, in case that the screen display works but is with one color only, for example blue, green, or red, it mainly results from software fault(possibly detected only on RGB TV).

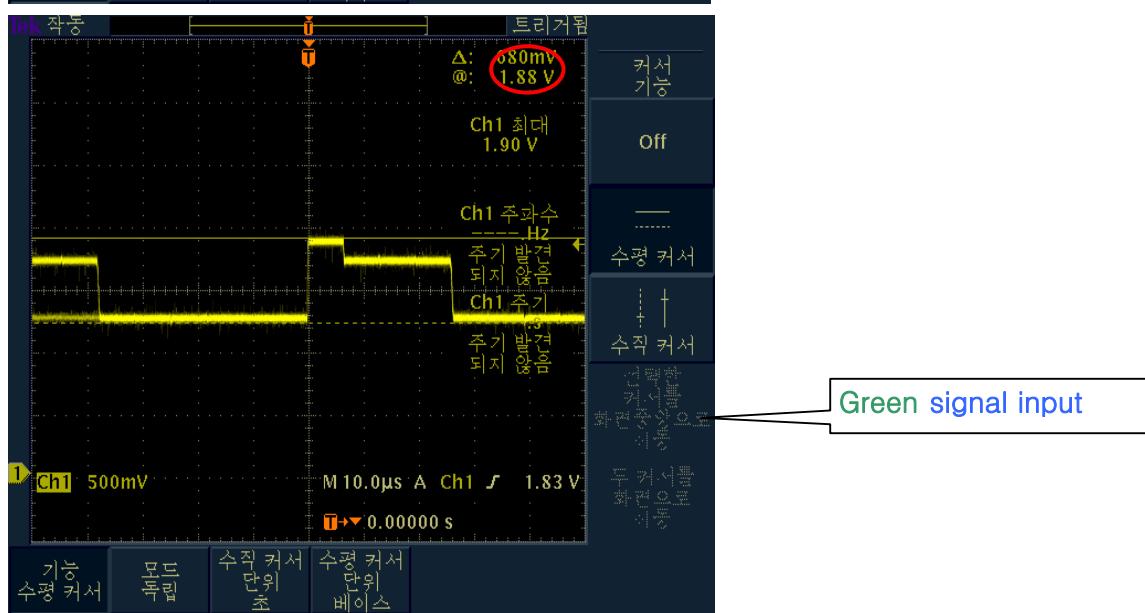

Red signal input

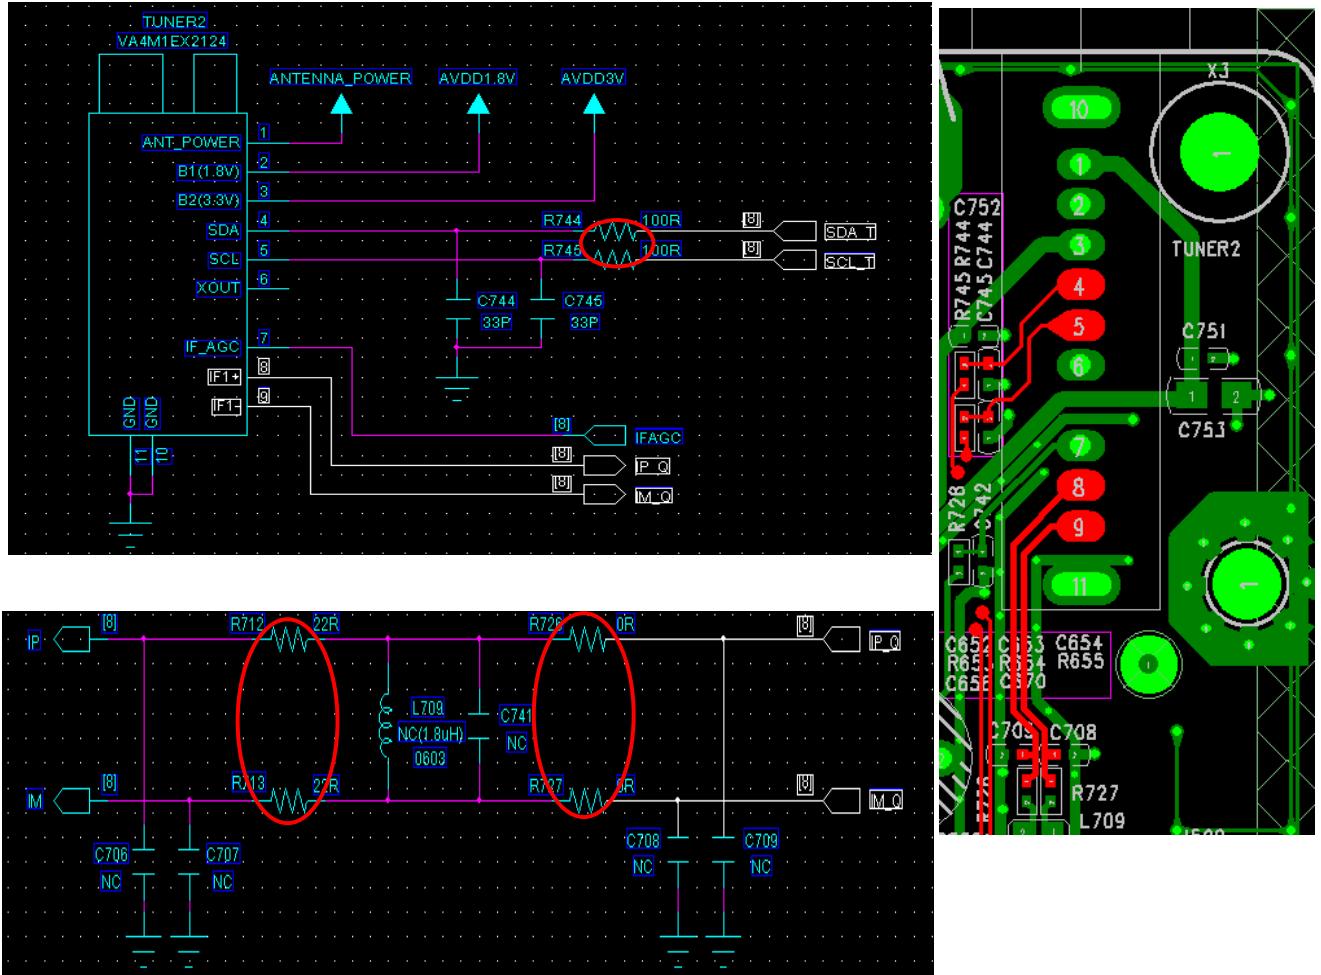

Blue signal input

Green signal input

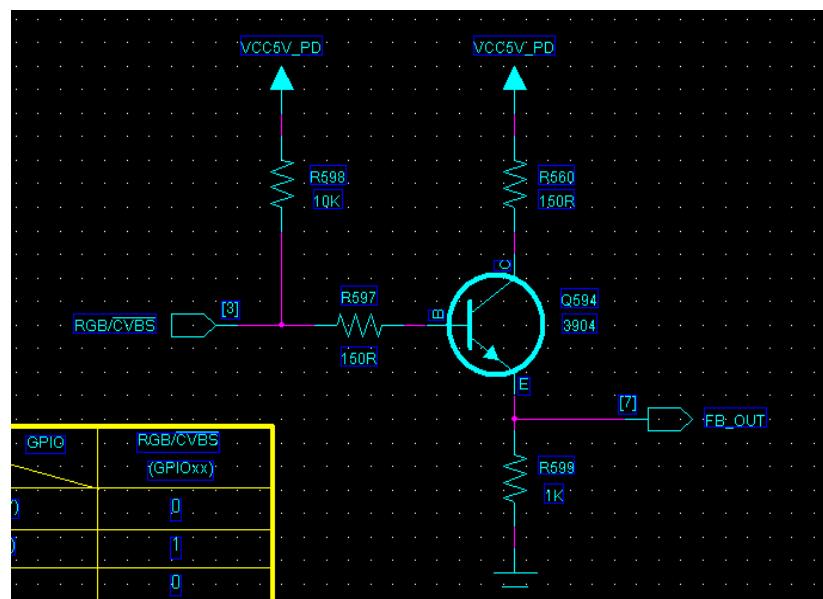

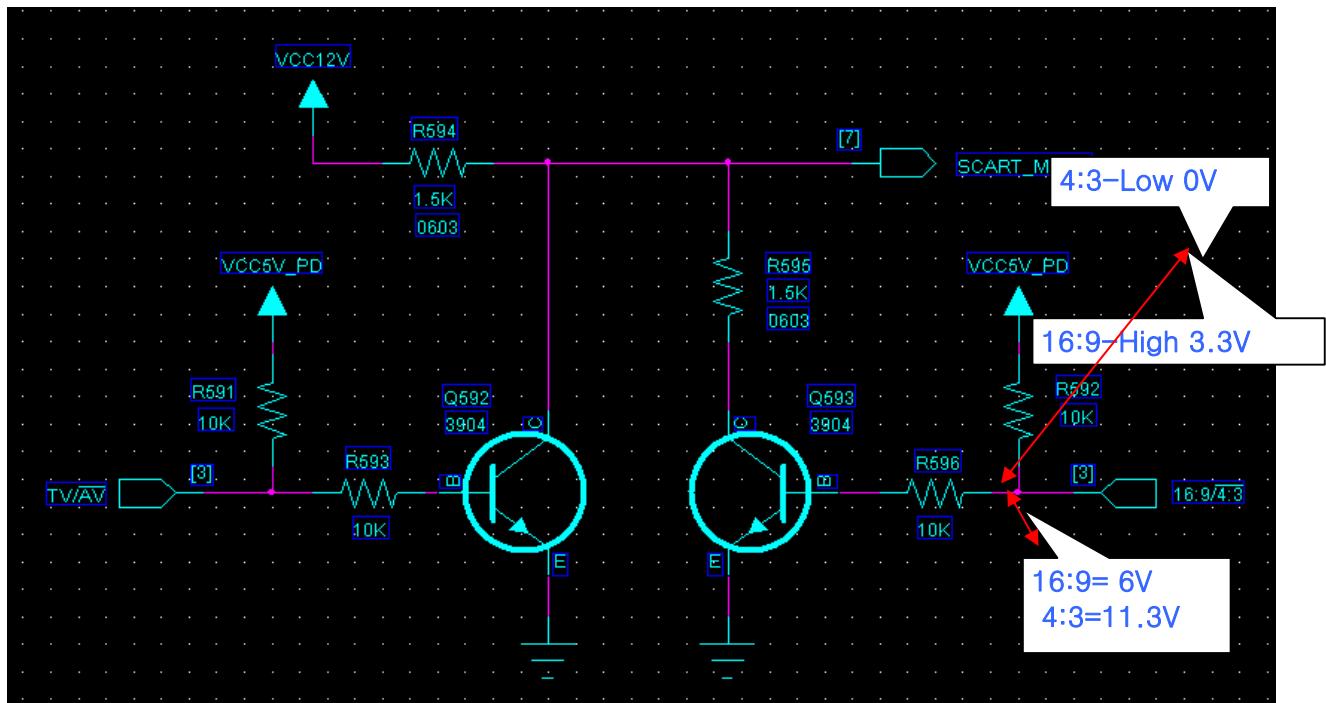

3) Weak TUNER signal

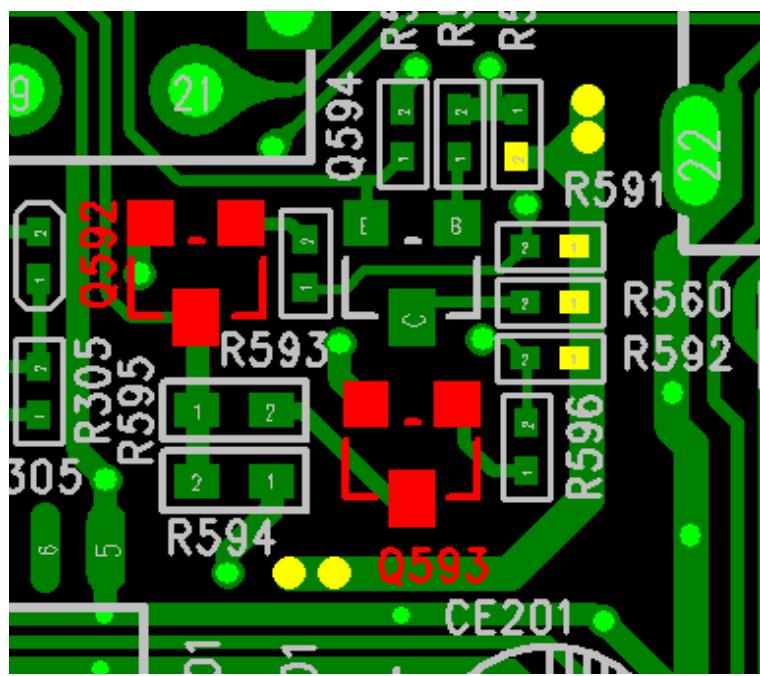

Check first that the voltage is impressed to LNB. If there is nothing wrong in LNB Voltage, check if the voltage is impressed well into TUNER bundle and if data flow out properly. If every condition is satisfied, TUNER itself can be considered to be defective. In occasion, precise inspection should be done in case that there is SHORT between pins(fault rarely made by a worker).

4) Screen ratio problem

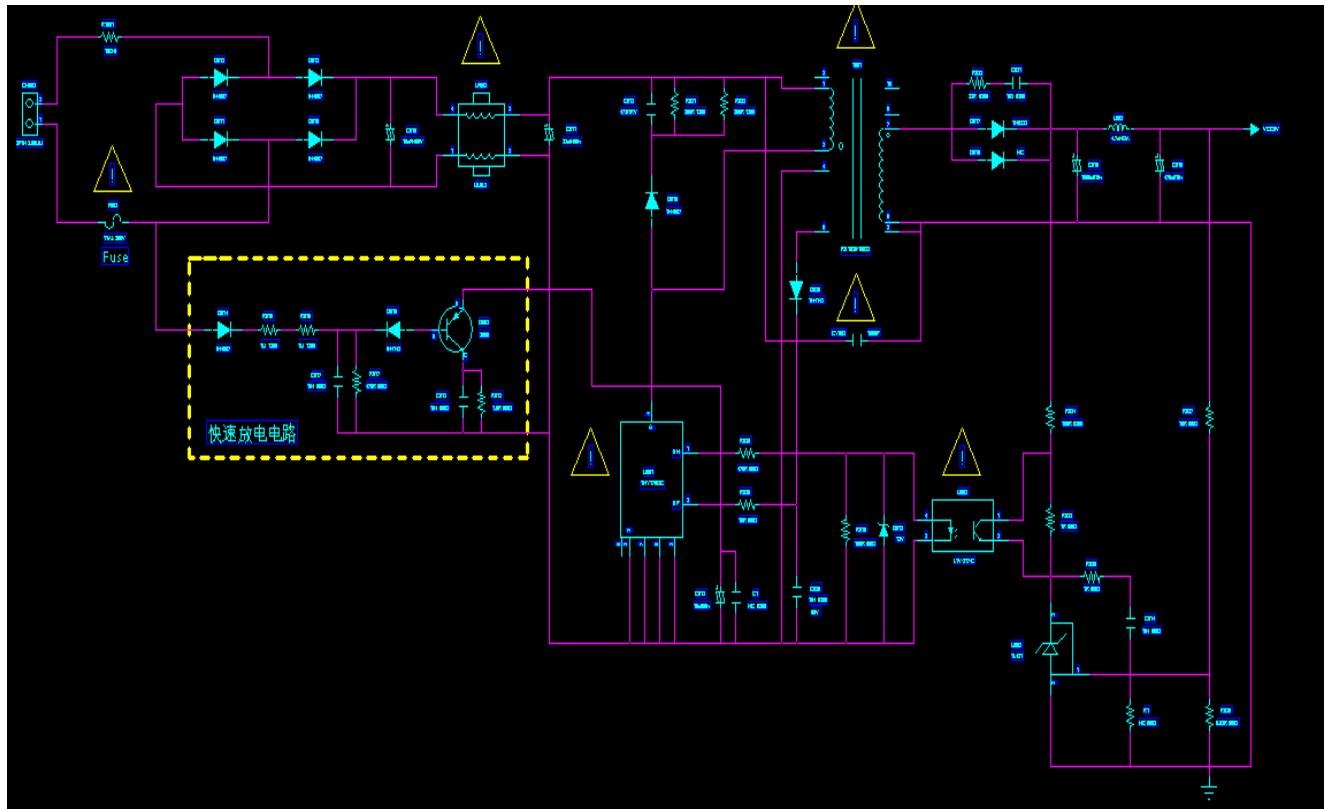

If a strange ratio in 4:3 and 16:9 is detected, the voltage of TV scart pin number 8 is below 9V. In case of around 7V, screen will be shown with 16:9 ratio. In case of over 10V, the ratio will be 4:3. If there is still a fault on screen after adjusting screen ratio, it means the resistance of R595 on the circuit is not 1K. If the voltage is normal but the voltage switch does not operate properly, it means that Q593 TR is not operating normally. In addition, Q592 can affect the problem because Q592 is a TV/sat transferring switch .

16	1	U903	Regulator MOSFET:ZL431AZ-ATRE1 ,precision is 0.4% ,TO-92
17	1	U902	光耦: LTV-817-CN, 200~400%, DIP-4
18	1	U901	Power switch IC:TNY176PN DIP-8C
19	2	Y401 Y701	晶体: 24.000MHZ,±20PPM, 20pF, HC-49S DIP
20	1	LF902	Filter Transformer: LB1111-8496A,17*12*17mm,4Pin,Pin Length:3.5mm
21	1	T901	变压器: KB1025-17474 , EE-19, 5 (二脚空缺) +5 (六八十脚空缺) Pin, 立式
22	1	F902	双冒绕丝保险管:3T 250V/1A, φ4×11mm
23	1	RT901	R-NTC: 10 OHM,20%,负温系数,黑色
24	1	CN902	CH-3x3.96 (NO Middle PIN)
25	1	CN401	2.54-4Z,TJC3-4A PITCH=2.54MM,4P,WITH LOCK
26	1	J301	AV4-8.4-33 WYRB 带屏蔽
27	1	J502	SMARTCARD: ICA-611 STF, Standoff H=17.10mm 常闭, 10Pin 汉宝
28	1	J801	Single SCART Connector no shield cover SC103 21P
29	1	IR101	IC-REMOTE CONTROL ; HM338-WS 3PIN
30	1	FOR IR101	SUPPER :7MM
31	1	D122	4-digit 7-segment display: LIM-2483N25E 单排6mm+13mm 12pin 橙色共阴 黑面白胶
32	1	FOR D122	9mm SUPPORT
33	1	D191	3RG9HW M3/ LL-309IGM2E-I1-2A/AVL-313RGD-01,共阴(红绿双色)DIP

34	1	FOR D191	LED SUPPORT 12MM
35	1	J501	USB-A-04,USB插座, 側弯90度
36	1	SW101	SWITCH PUSH 6X6X2DH5 H:1.5mm
37		TUNER2	DVB-T2/T TUNER:FH-RT232A4 9+2PINS 立式
38	1	(FOR U401)	Heat SINK(25*25*20 white)

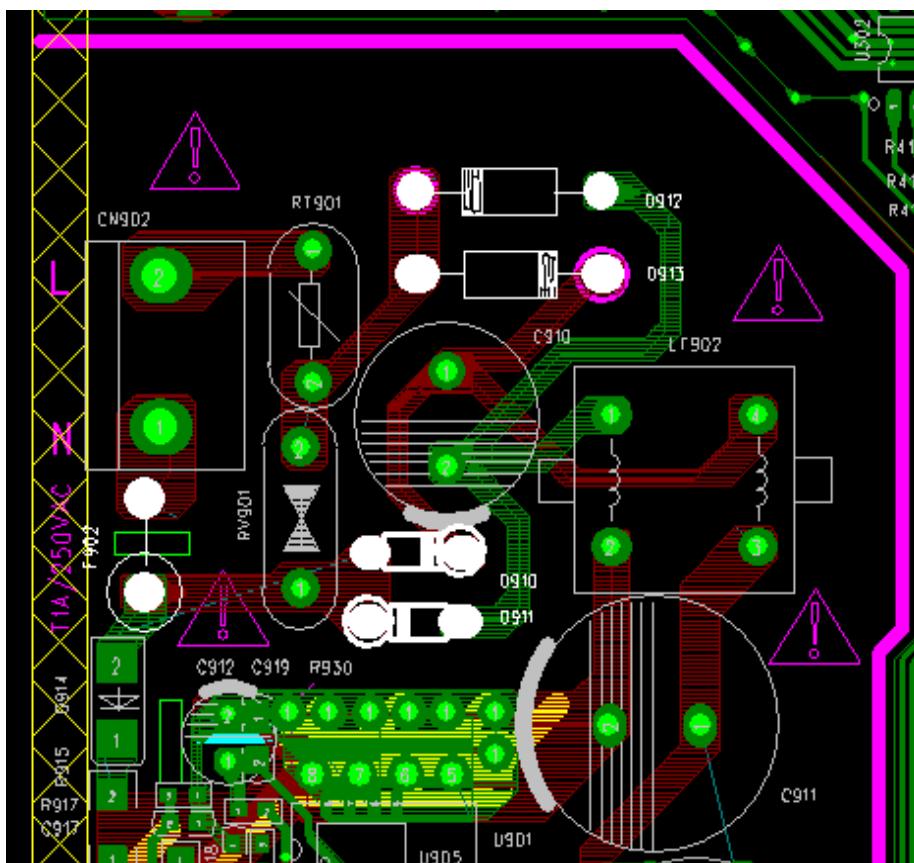

OTHER TROUBLESOOTHING

1, Testing the chip and the DEMOD's crystal frequency(Y401 Y701) with a frequency spectrograph, to make sure it's within $\pm 20\text{PPM}(\pm 480\text{HZ})$;

2, If there is a heavy mosaic when your STB works, or even NO SIGNAL, please change the crystal in the TUNER; and if that fails, change the Tuner module directly.

3, If the fuse blew out, please change the F902 and check the D910, D911, D912, D913, to see if they are burnout.
